

HIGHLIGHIS May 30 – June 5, 2021 Highlights provided by USDA/WAOB

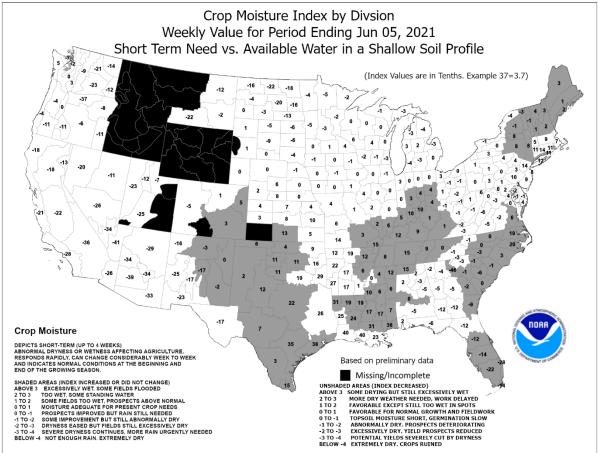

ot, dry weather developed across the **north-central** U.S., promoting a rapid pace of crop development but stressing rangeland, pastures, winter wheat, and spring-sown crops in drought-affected sections of the **northern Plains**. Adverse conditions extended into the parched West, where relentless, early-season heat heightened already rampant concerns regarding wildfires and water supplies. Two **Arizona** wildfires—the Mescal and Telegraph Fires, both east of **Phoenix**—started in early June and within days had collectively scorched more than 90,000 acres of

(Continued from front cover)

vegetation. In contrast, wet conditions persisted across the southern half of the Plains, slowing the early stages of the winter wheat harvest and late-season planting efforts. Wetness extended into the western Gulf Coast region, maintaining soggy conditions in pastures and for crops such as rice and cotton. Locally heavy showers also affected portions of the Mississippi Delta and neighboring areas, including the Tennessee Valley. Late in the week, increasingly showery weather in the Atlantic Coast States boosted topsoil moisture for pastures and summer crops. Some of the heaviest rain fell in southern Florida and the middle Atlantic coastal plain. As late-week heat spread eastward across the nation's northern tier, cooler-thannormal conditions persisted from the southern Plains into the Southeast. Weekly temperatures ranged from as much as 10°F below normal on the southern Plains to more than 10°F above normal in parts of Minnesota, Montana, and the Dakotas. Western heat boosted temperatures as much as 10 to 15°F above normal in California, the Great Basin, and the Northwest, further complicating an already serious regional drought situation that

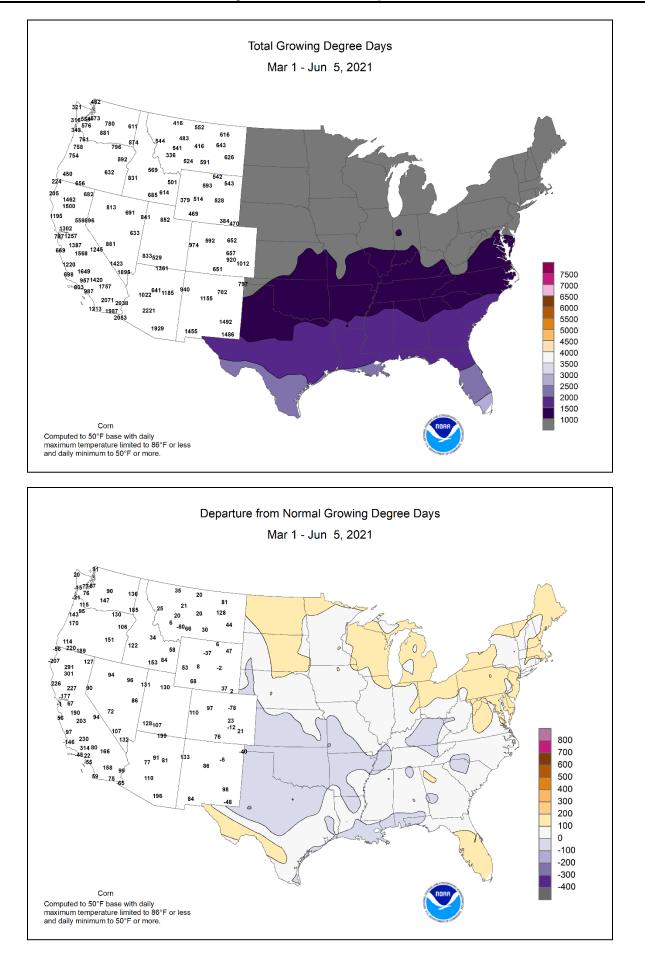

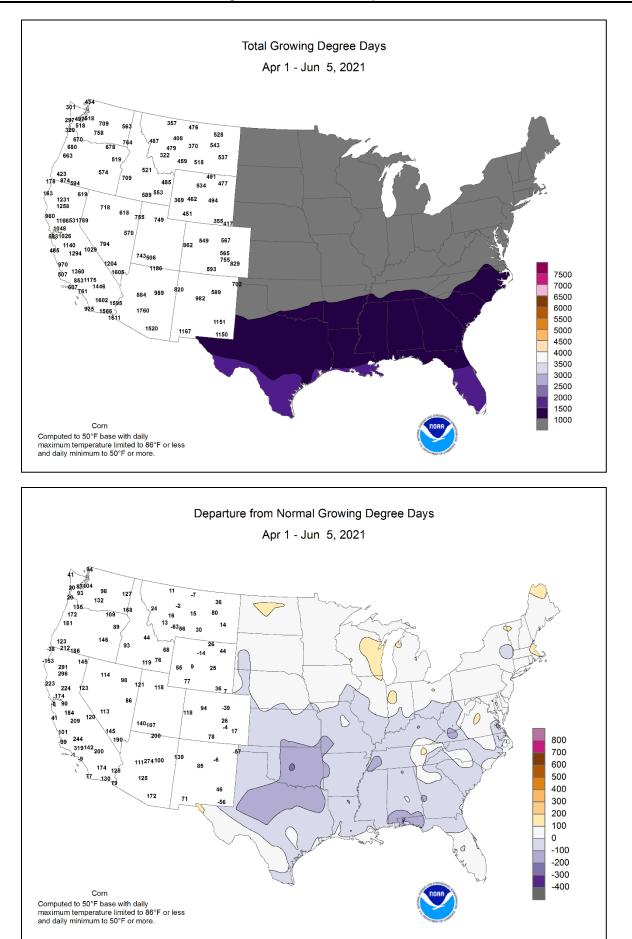

has been characterized by 2 years of sub-par snowfall; prematurely melting (or melted) snow; poor reservoir recharge due to parched soils absorbing already limited runoff; and abysmal rangeland and pasture conditions.

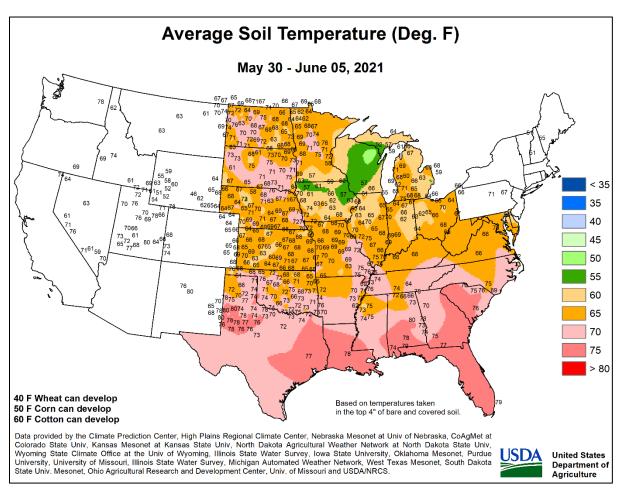

A May with little rainfall capped the driest spring on record in several Northwestern locations, including Portland, OR. March-May precipitation in Portland, just 2.52 inches (27 percent of normal), shattered the spring 1994 record of 4.31 inches. The month was also dry in portions of the middle and southern Atlantic States, where records for lowest May rainfall were broken in cities such as Danville, VA (0.63 inch), and Orlando, FL (0.17 inch). Farther west, however, heavy showers lingered across the southern Plains. Heavy rain fell as far west as eastern New Mexico, where Roswell experienced its wettest 4-day period on record in May. Roswell's 5.05-inch total from May 28-31, which included a 3.03inch deluge on the 30th, was surpassed only by multi-day events on July 12-15, 1991 (5.83 inches), and September 30 - October 3, 2019 (5.19 inches). In Texas, record-setting rainfall totals for May 31 included 3.56 inches in Abilene and 1.81 inches in Midland. McAllen, TX, collected a daily-record total (2.37 inches) for June 1. Another deluge occurred in McAllen on June 3, when 4.37 inches fell. As the week progressed, heavy showers began to shift eastward. In Alabama, daily-record amounts for June 2 reached 2.38 inches in Muscle Shoals and 1.46 inches in Huntsville. Fort Myers, FL, also collected a daily-record amount for June 2-a total of 4.77 inches-with most of the rain (4.63 inches) falling in a 90-minute period. In eastern North Carolina, June 2-4 rainfall totaled 4.20 inches in Elizabeth City and 3.88 inches in Raleigh-Durham.

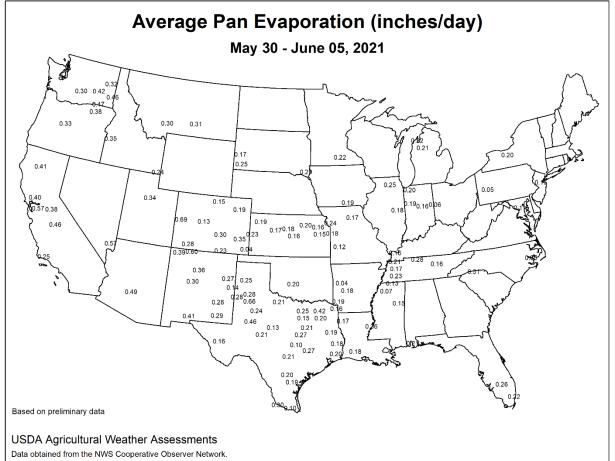

At the end of May, cool conditions lingered from the **Midwest into the Northeast. Midwestern** daily-record lows for May 30 included $37^{\circ}F$ in **Moline, IL**, and $38^{\circ}F$ in **Vichy-Rolla, MO**. With a low of $32^{\circ}F$, **Massena, NY**, also tallied a daily-record low for May 30. High temperatures on the 30th failed to reach the 50-degree mark in **Northeastern** locations such as **Worcester, MA** ($47^{\circ}F$), and **Albany, NY** ($48^{\circ}F$). In contrast, scorching heat developed at month's end in **California**, where **Redding** set a monthly record on May 31 with a high of $109^{\circ}F$ (previously, $108^{\circ}F$ on May 27, 1919, and May 28, 1984). Daily-record highs for May 31 in **California** rose to $108^{\circ}F$ in **Red Bluff** and $106^{\circ}F$ in **Ukiah** and downtown **Sacramento**. The first day of June featured triple-digit, daily-record highs in locations such as **Medford, OR**, and **Montague, CA**—both reached $102^{\circ}F$. **Montague** topped that mark with another daily-record high ($103^{\circ}F$) on June 2. In the Northwest, mid-week (June 2) highs soared to dailyrecord levels in dozens of locations, including Pasco, WA (104°F); Lewiston, ID (101°F); and Pendleton, OR (100°F). With a high of 98°F on June 3, Billings, MT, achieved its earliest reading of 98°F or greater (previously, June 4, 1988). Elsewhere on the 3rd, daily-record highs climbed to 120°F in Death Valley, CA; 103°F in Boise, ID; 101°F in Winnemucca, NV; and 100°F in Glasgow, MT. On June 4, Salt Lake City, UT (100°F), experienced its earliest triple-digit heat, clipping the record set last year on June 5, 2020. Torrid weather overspread the northern Plains and upper Midwest during the second half of the week, replacing previously cool conditions. On June 4-5, temperatures topped 100°F in parts of the Dakotas and Minnesota, resulting in some of the highest June temperatures on record. With a high of 105°F on June 4, Minot, ND, achieved a monthly record high (previously, 102°F on June 20, 1988). The following day in South Dakota, maxima of 104°F in Aberdeen and 101°F in Huron and Sioux Falls were the highest June readings since June 29, 2002. Aberdeen and Huron had not been as hot at any time of year since July 17, 2017; in Sioux Falls, it was the hottest day since August 30, 2012. On June 4, Bismarck, ND, reported 106°Fthe highest temperature in that location since July 23, 2007, and the highest June reading since June 29, 2002. Brainerd, MN (100°F on June 4), tied a monthly record originally set on June 19, 1988. Grand Forks, ND, which progressed from consecutive freezes on May 27-28 to a pair of tripledigit readings on June 4-5, weathered its first consecutive readings of 100°F or greater since August 7-8, 1949. Prior to this year, the last occurrence of triple-digit heat in Grand Forks had been June 17, 1995. At week's end, heat quickly shifted across the Midwest and East; record-setting highs for June 5 included 99°F in Minneapolis-Saint Paul, MN; 95°F in Green Bay, WI; and 94°F in Newark, NJ.

Near- or below-normal temperatures covered much of **Alaska**. Meanwhile, precipitation fell in several parts of the state but was heaviest in **southeastern Alaska**. **Juneau** reported daily-record rainfall totals (1.48 and 1.28 inches, respectively) on May 31 and June 2. Weekly rainfall in **Ketchikan** reached 7.59 inches, aided by totals exceeding 2 inches on May 31 and June 4. Farther south, warm, mostly dry weather prevailed across **Hawaii**. **Lihue, Kauai**, notched a daily-record high of 86°F on May 30. Monthly (May) rainfall at the state's major airport observation sites ranged from 0.03 inch (4 percent of normal) in **Honolulu, Oahu**, to 6.17 inches (88 percent) in **Hilo**, on the **Big Island**.

May Weather and Crop Summary

Weather

Weather summary provided by USDA/WAOB

Highlights: Frequent rain eased or eradicated drought across the central and southern Plains, benefiting rangeland, pastures, and spring-sown crops, but hampering initial winter wheat harvest efforts. By May 30, Texas' winter wheat harvest was just 18 percent complete, compared with 31 percent at the same time a year ago and the 5-year average of 24 percent.

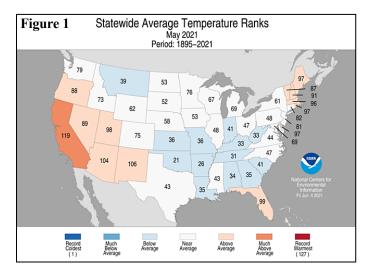

Rain also dampened the northern Plains and the Northwest, but improvements in the drought situation were limited by lingering subsoil moisture shortages and poor rangeland and pasture conditions. Even with the May precipitation, over one-half of the rangeland and pastures in North Dakota (67 percent) and Montana (56 percent) were rated in very poor to poor condition toward month's end, according to USDA/NASS. Adverse rangeland conditions extended into much of the West, where an additional six states—Arizona, California, New Mexico, Oregon, Utah, and Washington reported very poor to poor ratings ranging from 50 to 88 percent.

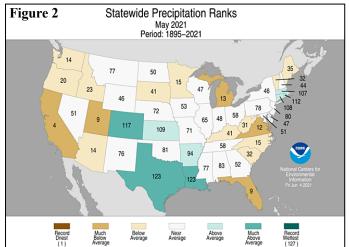

The poor start to the 2021 growing season extended to predominantly Northern crops such as spring wheat and barley. By May 30, one-fifth (20 percent) of the U.S. spring wheat and 13 percent of the barley were rated in very poor to poor condition. Among major production states, Washington led the nation on May 30 in very poor to poor ratings for both crops—51 percent of its spring wheat and 40 percent of its barley.

Mainly due to rain across the Plains, national drought coverage decreased from 48 to 44 percent during the 5-week period ending June 1, according to the U.S. Drought Monitor. During the same 5 weeks, drought coverage in the 11-state Western region decreased slightly from 84 to 82 percent, on the strength of improving conditions across the eastern slopes of the Rockies. However, Western coverage of extreme to exceptional drought (D3 to D4) increased by more than 3 percentage points during May, approaching 47 percent. Western wildfire and water-supply concerns continued to mount, fueled by depleted soil moisture, prematurely melted mountain snow, low reservoir levels, and ample cured vegetation.

The middle and southern Atlantic States also experienced May dryness, leading to topsoil moisture shortages and stress on pastures and emerging summer crops. In South Carolina, where topsoil moisture was rated 66 percent very short to short by May 30, more than one-quarter (26 percent) of the cotton and 22 percent of the peanuts were rated in very poor to poor condition. On the same date, topsoil moisture was rated 75 percent very short to short in Georgia, along with 70 percent in Florida. In contrast, wet weather led to fieldwork delays and local flooding from the western Gulf Coast region to the Mississippi Delta, where monthly rainfall totals of 10 to 20 inches or more were common. Louisiana led the nation on May 30 with topsoil moisture rated 49 percent surplus.

May featured numerous temperature swings, though the overall tendency was toward cooler conditions east of the Rockies and warm weather in the West. Some of the coolest May weather, relative to normal, covered the northern High Plains or stretched from the southern Plains into the Ohio Valley and interior Southeast. The hottest conditions (temperatures locally averaging more than 5°F above normal) affected California. Late in the month, freezes were reported in several areas across the nation's northern tier, burning back tender vegetation such as emerged summer crops. Scattered, late-month frost was noted in a broader area across the northern Plains, upper Midwest, Great Lakes, and interior Northeast.

Historical Perspective: According to preliminary data provided by the National Centers for Environmental Information, the contiguous U.S. experienced its 63rd-warmest, 62nd-wettest May during the 127-year period of record—very close to the middle of both historical distributions. The nation's monthly average temperature of 60.35°F was 0.15°F above the 20th century mean, while precipitation averaged 2.94 inches—101 percent of normal. Overall, it was the nation's driest May since 2014.

State temperature rankings ranged from the 21st-coolest May in Oklahoma to the ninth-warmest May in California (figure 1). Meanwhile, state precipitation rankings ranged from the fourth-driest May in California to the fifth-wettest May in Louisiana and Texas (figure 2). Joining California with topten May dryness were Florida and Utah.

Summary: May opened with some heat in the upper Midwest but with lingering cool weather in the East. On May 1, Midwestern daily-record highs rose above the 90degree mark in Iowa locations such as Mason City and Waterloo-both 93°F-as well as Rochester, MN (91°F). Farther east, however, scattered daily-record lows for May 1 dipped to 25°F in Flint, MI, and 32°F in Parkersburg, WV. Farther south, late-April downpours in the western Gulf Coast region carried into early May. Rain was notably heavy near the Texas coast, where Victoria logged consecutive daily-record totals (2.69 and 5.01 inches, respectively) on April 30 – May 1. Elsewhere in Texas, daily-record rainfall totaled exactly 2.01 inches in San Antonio (on April 30) and Del Rio (on May 1). Four-day (April 28 – May 1) rainfall reached 7.72 inches in Victoria and 7.13 inches in San Antonio. The San Bernard River near Boling, TX, crested on May 2 at 15.7 feet above flood stage-but 10.1 feet below the high-water mark set in the August 2017 aftermath of Hurricane Harvey.

Early-month temperatures topped 90°F across the southern High Plains, with Borger, TX, posting a daily-record high of 96°F on May 2. Scattered daily-record highs were also reported in other areas, including California, Florida, and southern Texas. Daily-record highs included 107°F (on May 3) in Laredo, TX, and 96°F (on May 5) in Lakeland, FL. Later, warmth began to expand eastward across the West. Daily-record highs reached 92°F (on May 6) in Lewiston, ID, and 88°F (on May 7) in Greybull, WY. In contrast, unusually cool air settled across the northern Plains and upper Midwest, resulting in multiple freezes that continued to slow winter wheat development and limit emergence of spring-sown crops. In the Northwest, freezes were reported at some interior locations. At times, scattered frost extended as far south as the central Plains and the Corn Belt. Dailyrecord lows were set in several locations, including Jamestown, ND (22°F on May 4), and Eau Claire, WI (27°F on May 8). Elsewhere on May 8, daily record-tying lows of 32°F were noted in Cedar Rapids, IA, and Moline, IL. From May 3-11, Grand Forks, ND, reported nine consecutive hard freezes, with low temperatures of 28°F or below. The only other instance of at least nine consecutive hard freezes in Grand Forks during May was May 1-9, 1954. In addition, Grand Forks has reported at least nine hard freezes during all of May in only five other years: 1907, with thirteen hard freezes; 2002, with eleven; 1929, with ten; 1945, with nine; and 1954, with nine.

Impressive Southern rainfall occurred on May 4, when dailyrecord totals topped 3 inches in Alabama locations such as Birmingham (3.59 inches) and Huntsville (3.25 inches). On the same date, daily-record totals exceeded 2 inches in Bowling Green, KY (3.11 inches); Anniston, AL (2.97 inches); and Greenville-Spartanburg, SC (2.16 inches). In addition, there were numerous reports of severe weatherhigh winds, large hail, and isolated tornadoes-across the Southeast from May 2-4. Periodic heavy showers extended into other regions, including the East and Midwest. Dailyrecord rainfall totaled 1.41 inches (on May 3) in Columbia, SC, and 1.22 inches (on May 2) in Houghton Lake, MI. As the week progressed, cold air became more deeply entrenched across the North. In Caribou, ME, precipitation on May 5-6 totaled 0.89 inch, with a trace of snow falling on the latter date. Sioux Falls, SD, recorded a trace of snow on May 8, while Ennis, MT, received 2.3 inches in a 24-hour period on May 7-8. During the same period, Ennis collected precipitation totaling 1.60 inches-the wettest 24-hour period during May in that location since 1944. Elsewhere in Montana, Glasgow netted a daily-record sum of 0.74 inch on May 8, representing the wettest day in that location since September 7, 2020. From January to May, Glasgow's precipitation totaled just 2.36 inch (53 percent of normal).

Subsequently, a storm system crossing the Midwest and mid-Atlantic produced heavy rain. Record-setting rainfall totals for May 9 included 1.85 inches in Fort Wayne, IN; 1.61 inches in Peoria, IL; 1.43 inches in Columbus, OH; and 1.17 inches in Pittsburgh, PA. Meanwhile, a separate area of heavy showers affected the western and central Gulf Coast States, where daily-record amounts reached 3.59 inches (on May 9) in Lufkin, TX, and 4.10 inches (on May 10) in New Orleans, LA. On May 11, additional heavy rain in the Gulf Coast States resulted in daily-record totals in Shreveport, LA (3.22 inches), and Pensacola, FL (1.78 inches). A few days later, a drier weather pattern developed across much of the country, although showers and thunderstorms continued to pepper the central and southern Plains. Dodge City, KS, netted a 6-day sum of 1.63 inches, with 0.59 and 1.04 inches falling on May 10-11 and 14-15, respectively. Farther north, however, January 1 – May 15 precipitation totaled less than an inch in North Dakota locations such as Jamestown (0.92 inch, or 23 percent of normal) and Hettinger (0.52 inch, or 17 percent).

As the middle of the month approached, heat across the Deep South led to daily-record highs for May 9 in Del Rio, TX (106°F), and Naples, FL (93°F). Meanwhile, warmth briefly affected areas along the Pacific Coast. In California, recordsetting highs for May 10 reached 94°F in Napa and 84°F at the San Francisco Airport. In contrast, unusually cool air settled across the Plains and Midwest. On May 11, dailyrecord lows dipped to 21°F in International Falls, MN; 25°F in Eau Claire, WI; and 30°F in Muskegon, MI. On the central and southern Plains, where cloudy, damp weather prevailed, high temperatures on May 11 remained below the 50-degree mark in Goodland, KS (46°F), and Amarillo, TX (49°F). Later, Raleigh-Durham, NC, reported a May 12 high of 57°F-more than 20°F below normal. Later, numerous daily-record lows were reported across the East and Midwest. Danville, VA, notched a daily-record low of 37°F on May 13. Consecutive daily-record lows occurred on May 14-15 in Raleigh-Durham (37 and 40°F, respectively) and Jackson, TN (40 and 42°F). Late-week, daily-record lows dipped below the 40-degree mark in Cape Girardeau, MO (39°F on May 14), and Parkersburg, WV (36°F on May 15).

As the second half of the month began, cool air remained in place across the Southeast. In Florida, record-setting lows for May 16 dipped to 50°F in Jacksonville and 59°F in Leesburg. Several days later, a warming trend commenced across the Midwest and Northeast, while chilly air settled across the northern High Plains and the Northwest. By May 19, daily-record lows included 26°F in Kalispell, MT, and 33°F in Quillayute, WA. From May 20-22, Great Falls, MT, reported three consecutive daily-record lows of 26°F. A trio of daily-record lows also occurred from May 20-22 in Montana locations such as Billings (32, 31, and 31°F); Helena (28, 27, and 29°F); and Holter Dam (29, 25, and 25°F). In addition, May 20-21 snowfall in Montana totaled 7.8 inches in Helena and 5.1 inches in Great Falls. Other Montana snowfall totals during that 2-day period included 6.8 inches in Havre and 4.0 inches in Lewistown. West Yellowstone, MT, reported 10 inches of snow in a 24-hour period on May 21-22. Maximum temperatures remained below the freezing mark on May 21 for the first time on record in Montana locations such as Lewistown (high of 29°F), Great Falls (30°F), Cut Bank (30°F), and Ennis (31°F). Record-setting temperatures also extended far beyond Montana. Daily-record lows included 25°F (on May 21) in South Lake Tahoe, CA; 25°F (on May 22) in Marysvale, UT; and 38°F (on May 22) in Kingman, AZ. Strong winds accompanied the Southwestern cool spell; Arizona gusts on May 22 were clocked to 61 mph in Springerville, 59 mph in Winslow, and 55 mph in Flagstaff. Meanwhile in the Northeast, an early-season warm spell pushed record-setting highs for May 20 to 92°F in Burlington, VT, and 90°F in Buffalo, NY. Two days later, daily-record Eastern highs for May 22 soared to 94°F at Atlantic City, NJ, and New York's JFK Airport.

Another round of heavy rain pounded coastal Texas in mid-May before slowly shifting eastward. Totals in Texas for May 16 included 5.40 inches in Palacios and 3.43 inches in Victoria. Additional rounds of heavy rain in Victoria totaled 5.30 and 2.60 inches, respectively, on May 18 and 19, along with more than an inch on May 22 and 23. As a result, Victoria's 8-day (May 16-23) rainfall reached 14.40 inches, while Palacios netted 13.70 inches. Exceptionally heavy rain fell on May 17 in Lake Charles, LA (12.49 inches), and Beaumont-Port Arthur, TX (9.86 inches). For Lake Charles, it was the third-wettest day on record, behind 15.79 inches on June 19, 1947, and 15.67 inches on May 16, 1980. May 16-22 rainfall totaled 17.32 inches in Lake Charles and 14.60 inches in Beaumont-Port Arthur. May 17 wetness resulted in other daily-record totals in Louisiana-for example, 6.37 inches in Lafayette and 4.34 inches in New Iberia-as well as portions of the central Plains (2.86 inches in Imperial, NE) and Ohio Valley (1.53 inches in Cincinnati, OH). The following day, record-breaking rainfall amounts for May 18 reached 3.48 inches in Tyler, TX; 1.68 inches in Quincy, IL; and 1.49 inches in North Little Rock, AR. Later, precipitation shifted northward-and included the previously mentioned snow in Montana-although heavy showers lingered in the western Gulf Coast region. Daily-record amounts for May 21 totaled 0.61 inch in Eureka, NV, and 0.32 inch in Twin Falls, ID. In Nevada, May 21-22 snowfall totaled 3.4 inches in Ely and 1.5 inches in Elko. In North Dakota, rainfall in Dickinson totaled 2.23 inches from May 20-23, helping to boost the year-to-date sum through May 31 to 4.33 inches (86 percent of normal).

Late-May weather featured freezes in several areas across the nation's northern tier, especially from North Dakota to Maine, burning back tender vegetation such as emerged summer crops. Scattered, late-week frost was noted in a broader area across the northern Plains, upper Midwest, Great Lakes, and interior Northeast. As the last full week of May began, record-setting warmth prevailed in the East. Record-setting highs for May 23 included 94°F in Wilmington, DE, and Atlantic City, NJ. Southeastern heat lingered for several additional days. Daily-record highs soared to 98°F (on May 24) in Lumberton, NC; 95°F (on May 26) in Richmond, VA; and 98°F (on May 27) in Wilmington, NC. There was also a brief heat surge into the Great Lakes and Northeastern States. In Michigan, dailyrecord highs for May 25 rose to 90°F in Lansing and Battle Creek. In Maine, record-setting highs for May 26 climbed to 91°F in Millinocket and 89°F in Houlton. Farther west, however, daily-record lows for May 23 dipped to 20°F at Utah's Bryce Canyon Airport and 22°F in Flagstaff, AZ. Temperatures quickly rebounded, though, as Ramona, CA, experienced a daily-record low (34°F) on May 23, followed the next day by a daily-record high (91°F). Later, a significant, late-season push of chilly air settled across the northern Plains, Midwest, and Northeast. On May 28-29, Minnesota locations such as Hibbing (21 and 22°F, respectively) and Duluth (30 and 29°F) registered consecutive daily-record lows. From May 28-30, Massena, NY, reported three consecutive freezes (32, 29, and 32°F) the first freezes since late April in that location. Freezes and daily-record lows occurred on May 29 in locations such as Rhinelander, WI (26°F); Livingston, MT (29°F); and Eau Claire, WI (32°F). Eau Claire's only later final spring freezes occurred on June 12, 1903, and June 6, 1897; readings of 32°F were also reported on May 29, 1965 and 1966. Meanwhile in northern Iowa, Hampton's low of 32°F on May 29 represented its second-latest spring freeze on record, trailing only May 31, 1897-and tied with May 29, 1947. In Binghamton, NY, the temperature remained below the 50degree mark on 3 consecutive days from May 28-30, peaking at 49, 45, and 48°F. Binghamton's rainfall during the 3-day period totaled 1.90 inches.

Toward month's end, repeated rounds of rain across the nation's mid-section spread to other parts of the country. On May 25, daily-record rainfall totals included 2.35 inches in Wisconsin Rapids, WI, and 1.58 inches in Abilene, TX. The following day, Texarkana, AR, received 3.65 inches, a station record for May 26. Joplin, MO, collected 3.07 inches on May 27, a daily record. Farther north, a trace of snow fell on May 26 in International Falls, MN, and on May 27 in Bismarck, ND. Late in the month, heavy showers swept into the East and lingered across the south-central U.S. Austin, TX, registered a daily-record sum (2.66 inches) on May 28 and tallied a monthly total of 12.27 inches (245 percent of normal). In Louisiana, May rainfall was more than a foot above normal at Lake Charles, where 20.50 inches fell, as well as Lafayette (19.17 inches) and New Iberia (17.61

inches); those totals ranged from 352 to 401 percent of normal. Heavy rain fell as far west as eastern New Mexico, where Roswell experienced its wettest 4-day period on record in May. Roswell's 5.05-inch total from May 28-31, which included a 3.03-inch deluge on the 30th, was surpassed only by multi-day events on July 12-15, 1991 (5.83 inches), and September 30 – October 3, 2019 (5.19 inches). Farther east, daily-record rainfall totals for May 28 reached 1.98 inches in Clarksburg, WV, and 1.55 inches in Islip, NY. The month ended on a wet note in Texas, where record-setting amounts for May 31 included 3.56 inches in Abilene and 1.81 inches in Midland. Elsewhere, scorching heat developed at month's end in California, where Redding set a monthly record on May 31 with a high of 109°F (previously, 108°F on May 27, 1919, and May 28, 1984). Daily-record highs for May 31 in California soared to 108°F in Red Bluff and 106°F in Ukiah and downtown Sacramento.

For much of Alaska, the month of May featured near- or above-normal temperatures and near- or below-normal precipitation. The driest conditions, relative to normal, covered the western half of mainland Alaska. Fairbanks posted highs of 60°F or greater each day from May 8-21 and reached or exceeded 70°F on May 24-26 and 30-31. On May 10, Nome attained a 55-degree reading for the first time since September 7, 2020. Later, Nome peaked at 71°F on May 25, topping the 70-degree mark for the first time since July 11, 2020. However, snow briefly fell in the Brooks Range and neighboring areas, with Bettles reporting 2.4 inches on May 19. Farther south, Anchorage, noted consecutive dailyrecord rainfall totals (0.28 and 0.58 inch, respectively) occurred on May 28-29. Juneau reported measurable rain on each of the last 11 days of May, totaling 3.88 inches. For the month, Juneau's rainfall reached 6.91 inches (197 percent of normal).

Most of Hawaii experienced typical late-spring weather, albeit somewhat warmer and drier than normal. On Oahu, Honolulu notched a daily-record high of 89°F on May 27. At the state's major airport observation sites, May rainfall ranged from 0.03 inch (4 percent of normal) in Honolulu to 6.17 inches (88 percent) in Hilo, on the Big Island.

Fieldwork

Fieldwork summary provided by USDA/NASS

May was cooler than average for most of the eastern and central U.S. Large parts of the Mississippi Valley, Ohio Valley, and southern Plains recorded temperatures 2°F or

more below normal. Much of the northern Rockies also recorded below-normal temperatures, but most of the western one-third of the nation was warmer than average. Most of California recorded temperatures 2°F or more above normal. Meanwhile, much of the East and West experienced drier-than-normal weather, twice the normal amount of rainfall was recorded in parts of Colorado, Kansas, Louisiana, and Texas. Large sections of the western Gulf Coast received at least 12 inches of rain.

By May 2, producers had planted 46 percent of the nation's corn, 2 percentage points behind last year but 10 points ahead of the 5-year average. Eight percent of the corn acreage had emerged by May 2, one percentage point ahead of the previous year but 1 point behind average. By May 16, producers had planted 80 percent of the nation's corn, 2 percentage points ahead of last year and 12 points ahead of average. Forty-one percent of the corn had emerged by May 16, one percentage point ahead of the previous year and 6 points ahead of average. By May 30, producers had planted 95 percent of the nation's corn, 3 percentage points ahead of last year and 8 points ahead of average. At that time, corn planting progress was at or ahead of average in 16 of the 18 estimating states. Eighty-one percent of the nation's corn had emerged by May 30, five percentage points ahead of the previous year and 11 points ahead of average. On May 30, seventy-six percent of the corn was rated in good to excellent condition, 2 percentage points above the same time last year.

Twenty-four percent of the nation's soybean acreage was planted by May 2, three percentage points ahead of last year and 13 points ahead of the 5-year average. Sixty-one percent of the soybeans were planted by May 16, ten percentage points ahead of last year and 24 points ahead of average. Twenty percent of the nation's soybeans had emerged by May 16, four percentage points ahead of last year and 8 points ahead of average. Eighty-four percent of the nation's soybeans were planted by May 30, ten percentage points ahead of last year and 17 points ahead of average. At that time, soybean planting progress was ahead of average in 16 of the 18 estimating states. Sixty-two percentage points ahead of last year and 20 points ahead of average.

By May 2, twenty-seven percent of the nation's winter wheat was headed, 3 percentage points behind the previous year and 7 points behind the 5-year average. By May 16, fifty-three percent of the winter wheat was headed, 1 percentage point behind the previous year and 5 points behind average. By May 30, seventy-nine percent of the winter wheat was headed, 3 percentage points ahead of the previous year and 1 point ahead of average. On May 30, forty-eight percent of the 2021 winter wheat crop was reported in good to excellent condition, 3 percentage points below the same time last year.

Nationwide, 16 percent of the cotton was planted by May 2, one percentage point behind the previous year but equal to the 5-year average. Thirty-eight percent of the cotton was planted by May 16, four percentage points behind the previous year and 2 points behind average. Nationally, 64 percent of the cotton was planted by May 30, equal to the previous year but 1 percentage point behind average. Six percent of the nation's cotton acreage had reached the squaring stage by May 30, two percentage points behind last year and 1 point behind average. On May 30, forty-three percent of the 2021 cotton acreage was rated in good to excellent condition, 1 percentage point below last year.

Twenty percent of the nation's sorghum was planted by May 2, two percentage points behind the previous year and 4 points behind the 5-year average. Twenty-seven percent of the sorghum acreage was planted by May 16, four percentage points behind the previous year and 5 points behind average. Forty-one percent of the nation's sorghum was planted by May 30, seven percentage points behind the previous year and 4 points behind average.

By May 2, producers had seeded 64 percent of the nation's 2021 rice acreage, 16 percentage points ahead of the previous year and 4 points ahead of the 5-year average. By May 2, thirty-eight percent of the rice acreage had emerged, 7 percentage points ahead of last year but 5 points behind average. By May 16, producers had seeded 87 percent of the nation's rice, 8 percentage points ahead of the previous year and 6 points ahead of average. By May 16, sixty-three percent of the rice had emerged, 8 percentage points ahead of last year but 1 point behind average. By May 23, producers had seeded 95 percent of the nation's rice, 7 percentage points ahead of the previous year and 5 points ahead of average. Planting progress was ahead of the 5year average in five of the six estimating states at that time. By May 30, eighty-six percent of the nation's rice had emerged, 6 percentage points ahead of last year and 3 points ahead of average. On May 30, seventy-four percent of the rice acreage was rated in good to excellent condition, 5 percentage points above the same time last year.

Nationally, oat producers had seeded 72 percent of this year's acreage by May 2, seven percentage points ahead of

the previous year and 10 points ahead of the 5-year average. At that time, oat planting progress was at or ahead of average in all nine estimating states. Forty-seven percent of the oats had emerged by May 2, five percentage points ahead of last year and 4 points ahead of average. Nationally, oat producers had seeded 92 percent of this year's acreage by May 16, seven percentage points ahead of the previous year and 8 points ahead of average. Seventythree percent of the nation's oats had emerged by May 16, six percentage points ahead of last year and 7 points ahead of average. Ninety-one percent of the oats had emerged by May 30, six percentage points ahead of last year and five points ahead of average. Thirty-one percent of the oat acreage had headed by May 30, four percentage points ahead of last year and three points ahead of average. On May 30, fifty-five percent of the nation's oat acreage was rated in good to excellent condition, 16 percentage points below the same time last year.

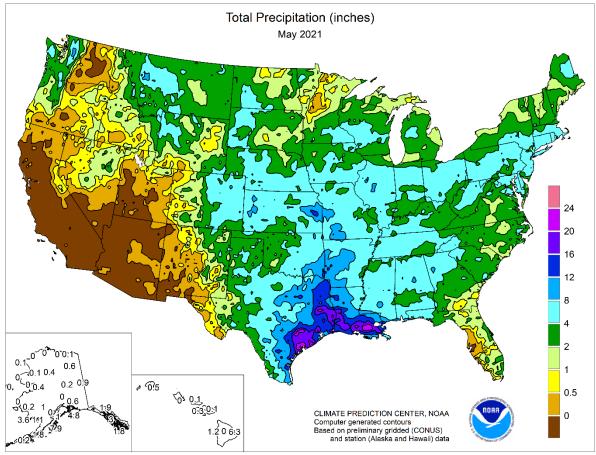

Fifty-three percent of the nation's barley was planted by May 2, fourteen percentage points ahead of last year and 12 points ahead of the 5-year average. Seventeen percent of the barley had emerged by May 2, six percentage points ahead of the previous year and 1 point ahead of average. Eighty-three percent of the barley crop was planted by May 16, thirteen percentage points ahead of last year and 7 points ahead of average. Fifty percent of the nation's barley had emerged by May 16, nine percentage points ahead of the previous year and 6 points ahead of average. Ninetyfive percent of the barley crop was planted by May 30, three percentage points ahead of last year and 1 point ahead of the average. Seventy-nine percent of the barley crop had emerged by May 30, seven percentage points ahead of the previous year and 3 points ahead of average. On May 30, forty-eight percent of the nation's barley acreage was rated in good to excellent condition, 21 percentage points below the same time last year.

By May 2, forty-nine percent of the nation's spring wheat was seeded, 22 percentage points ahead of last year and 17 points ahead of the 5-year average. By May 2, fourteen percent of the spring wheat had emerged, 8 percentage points ahead of the previous year and 4 points ahead of average. By May 16, eighty-five percent of the spring wheat crop had been seeded, 28 percentage points ahead of last year and 14 points ahead of average. By May 16, fortyseven percent of the spring wheat had emerged, 19 percentage points ahead of the previous year and 11 points ahead of average. By May 30, ninety-seven percent of the nation's spring wheat had been seeded, 7 percentage points ahead of last year and 4 points ahead of average. Planting progress was ahead of the 5-year average in all six estimating states at that time. On May 30, eighty percent of the nation's spring wheat had emerged, 15 percentage points ahead of the previous year and 7 points ahead of average. On May 30, forty-three percent of the nation's spring wheat was rated in good to excellent condition, 37 percentage points below the same time last year.

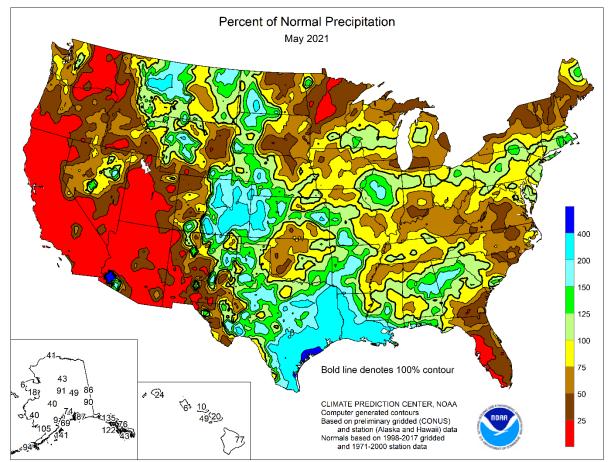

Nationally, producers had planted 11 percent of the 2021 peanut acreage by May 2, two percentage points behind the previous year and 4 points behind the 5-year average. Nationally, producers had planted 40 percent of the peanut acreage by May 16, three percentage points behind the previous year and 9 points behind average. Nationally, producers had planted 77 percent of the peanut acreage by May 30, one percentage point ahead of the previous year but 3 points behind average. On May 30, sixty-five percent of the nation's peanut acreage was rated in good to excellent condition, 3 percentage points below the same time last year.

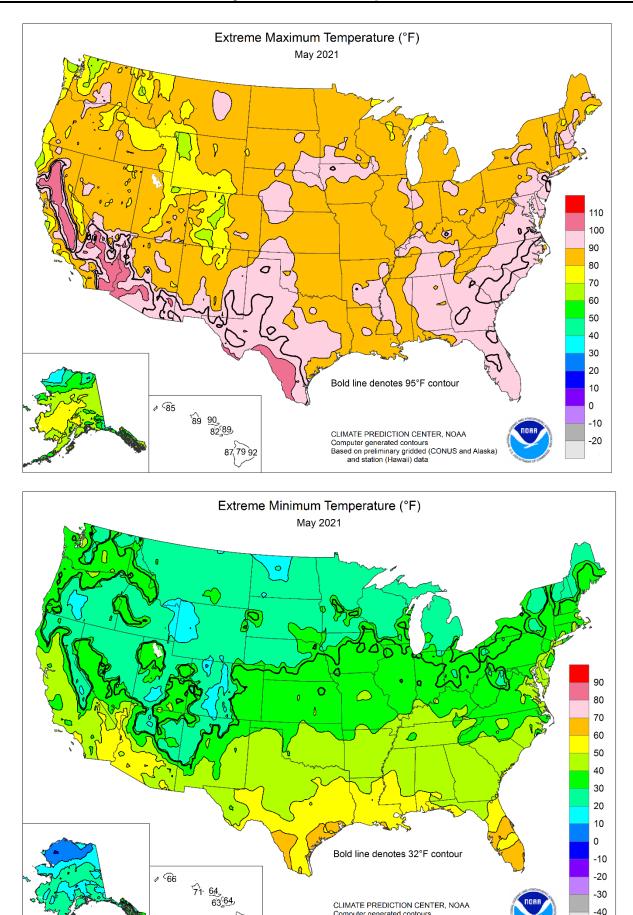

By May 2, eighty-one percent of the nation's sugarbeet crop was planted, 34 percentage points ahead of last year and 30 points ahead of the 5-year average. By May 9, ninety-seven percent of the sugarbeets had been planted, 39 percentage points ahead of last year and 26 points ahead of average.

Six percent of the nation's intended 2021 sunflower acreage was planted by May 16, two percentage points ahead of last year but 1 point behind the 5-year average. Forty-two percent of the sunflower acreage was planted by May 30, thirteen percentage points ahead of last year and 7 points ahead of average.

Based on 1981-2010 normals

National Agricultural Summary

May 31 – June 6, 2021

Weekly National Agricultural Summary provided by USDA/NASS

HIGHLIGHTS

Most of the western one-third of the nation remained drier than normal, as did the central and southern Appalachians, Florida Panhandle, Great Lakes, and northern Plains. In contrast, large parts of the middle Atlantic Coast, Mississippi Valley, southern Plains, and southern Rockies recorded higher-than-normal amounts of rain. Coastal areas in the Delta, North Carolina, and Texas recorded rainfall totaling 4 inches or more. Meanwhile, below-normal temperatures were recorded in the mid-Atlantic, Mississippi Valley, southern Plains, southern Rockies, and Southeast. Large areas of Oklahoma, Arkansas. and Texas reported temperatures 6°F or more below normal. In contrast, most of the western one-third of the nation, the northern Plains, the Great Lakes, and the Northeast were warmer than normal. Parts of California, Idaho, Nevada, North Dakota, Oregon, and Utah experienced weekly temperatures 12°F or more above normal.

Corn: Ninety percent of the nation's corn acreage had emerged by June 6, three percentage points ahead of the previous year and 8 points ahead of the 5-year average. Ninety-six percent of Iowa's corn acreage had emerged by June 6, equal to last year but 7 percentage points ahead of average. On June 6, seventy-two percent of the nation's corn was rated in good to excellent condition, 4 percentage points below the previous week and 3 points below the same time last year.

Soybean: Ninety percent of the nation's soybean acreage was planted by June 6, six percentage points ahead of last year and 11 points ahead of the 5-year average. Soybean planting progress was ahead of average in 17 of the 18 estimating states by the end of the week. Seventy-six percent of the nation's soybean acreage had emerged by June 6, eleven percentage points ahead of last year and 17 points ahead of average. On June 6, sixty-seven percent of the nation's soybeans were rated in good to excellent condition, 5 percentage points below the previous year.

Winter Wheat: By June 6, eighty-five percent of the nation's winter wheat was headed, 1 percentage point ahead of the previous year but 1 point behind the 5-year average. Two percent of the 2021 winter wheat acreage had been harvested by June 6, four percentage points behind last year and 5 points behind average. On June 6, fifty percent of the 2021 winter wheat crop was reported in good to excellent condition, 2 percentage points above the previous week but 1 point below the same time last year. In Kansas, the largest winter wheat-producing state, 65 percent of the winter wheat was rated in good to excellent condition.

Cotton: Nationwide, 71 percent of the cotton was planted by June 6, five percentage points behind the previous year and 7 points behind the 5-year average. In Texas, 60 percent of the 2021 cotton acreage was planted by June 6, twelve percentage points behind both last year and the average. Nine percent of the nation's cotton had reached the squaring stage by June 6, three percentage points behind last year and 2 points behind average. On June 6, forty-six percent of the 2021 cotton acreage was rated in good to excellent condition, 3 percentage points above both the previous week and the same time last year.

Sorghum: Fifty-two percent of the nation's sorghum was planted by June 6, ten percentage points behind the previous year and 7 points behind the 5-year average. Texas had planted 89 percent of its sorghum acreage by June 6, one percentage point ahead of last year but 1 point behind average. Seventy-

four percent of the nation's sorghum was rated in good to excellent condition on June 6, nineteen percentage points above the previous year.

Rice: By June 6, ninety-one percent of the nation's rice acreage had emerged, 4 percentage points ahead of last year but equal to the 5-year average. On June 6, seventy-five percent of the nation's rice was rated in good to excellent condition, 1 percentage point above the previous week and 5 points above the same time last year.

Small Grains: Ninety-five percent of the nation's oat acreage had emerged by June 6, five percentage points ahead of last year and three points ahead of the 5-year average. Thirty-seven percent of the nation's oats had headed by June 6, four percentage points ahead of last year and three points ahead of average. On June 6, forty-six percent of the nation's oats were rated in good to excellent condition, 9 percentage points below the previous week and 25 points below the same time last year.

Eighty-seven percent of the nation's barley had emerged by June 6, two percentage points ahead of the previous year and 1 point ahead of the 5-year average. On June 6, forty-three percent of the nation's barley was rated in good to excellent condition, 5 percentage points below the previous week and 36 points below the same time last year.

By June 6, ninety percent of the nation's spring wheat had emerged, 11 percentage points ahead of the previous year and 4 points ahead of the 5-year average. On June 6, thirty-eight percent of the nation's spring wheat was rated in good to excellent condition, 5 percentage points below the previous week and 44 points below the same time last year.

Other Crops: Nationally, producers had planted 87 percent of the 2021 peanut acreage by June 6, one percentage point behind the previous year and 2 points behind the 5-year average. Producers in Georgia, the largest peanut-producing state, had planted 93 percent of the 2021 intended acreage by week's end, 2 percentage points ahead of both the previous year and the average. On June 6, sixty-one percent of the nation's peanut acreage was rated in good to excellent condition, 4 percentage points below the previous week and 5 points below the same time last year.

Fifty-nine percent of the nation's intended 2021 sunflower acreage was planted by June 6, ten percentage points ahead of last year and 5 points ahead of the 5-year average.

Week Ending June 6, 2021

International Weather and Crop Summary

May 30 - June 5, 2021

International Weather and Crop Highlights and Summaries provided by USDA/WAOB

HIGHLIGHTS

EUROPE: Wet albeit warmer weather prevailed across most of Europe, maintaining good to excellent prospects for reproductive to filling winter crops.

WESTERN FSU: Soaking rain maintained adequate to abundant moisture supplies for reproductive to filling winter grains and oilseeds, though drier weather would be welcome as crops approach maturity.

EASTERN FSU: A much-needed respite from scorching heat and intensifying drought arrived in the north, while unfavorably hot, dry weather lingered in the south.

MIDDLE EAST: Showers in Turkey favored vegetative summer crops but were too late for maturing winter grains.

SOUTH ASIA: The onset of the southwest monsoon brought widespread showers to peninsular India, encouraging kharif crop sowing.

EASTERN ASIA: Wet weather in southern and northeastern China benefited vegetative summer crops.

SOUTHEAST ASIA: The wet season was off to a poor start in Thailand and environs, while more seasonable rainfall benefited summer-grown rice in the Philippines.

AUSTRALIA: Rain further benefited winter crops in the west and the northeast, but additional rain would be welcome in the southeast.

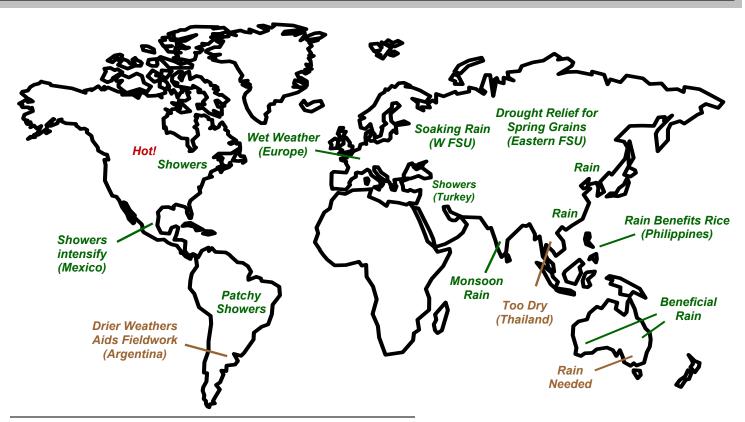

ARGENTINA: Conditions favored summer crop harvesting throughout most major farming areas.

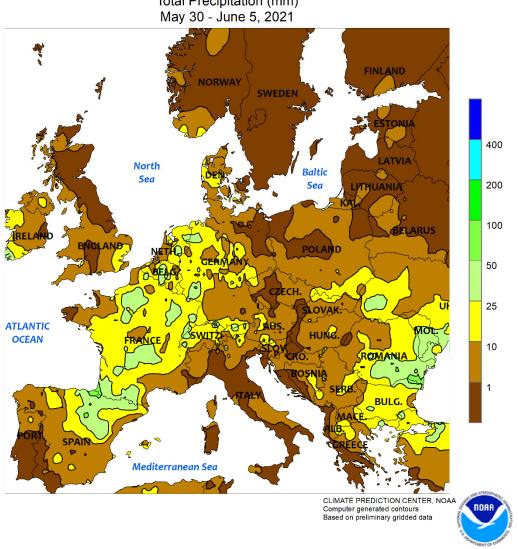

BRAZIL: Isolated showers brought limited relief from dryness to Brazilian corn.

MEXICO: Seasonal showers intensified, generating much-needed rainfall across the southern plateau corn belt.

CANADIAN PRAIRIES: Unseasonable heat and dryness fostered rapid declines in moisture available for emerging spring crops.

SOUTHEASTERN CANADA: Warm, showery weather benefited development of wheat and emerging summer crops.

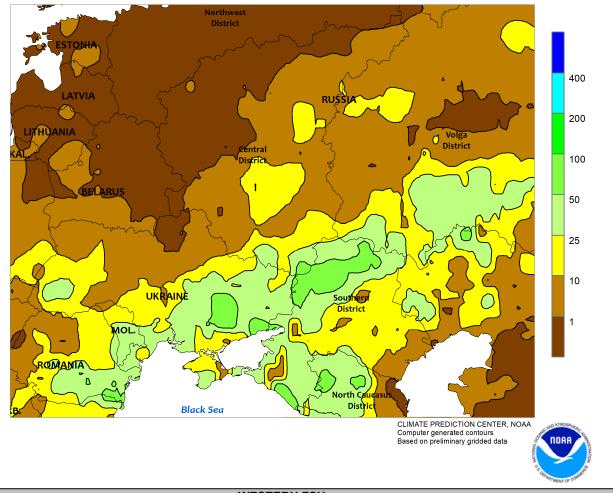

EUROPE Total Precipitation (mm) May 30 - June 5, 2021

EUROPE

Unsettled albeit warmer weather prevailed across much of Europe, maintaining good to excellent winter crop prospects and eliminating the last vestiges of spring drought in the west. Storms continued to march slowly across the continent, netting crop areas from Spain into France, Germany, and southeastern England 5 to 65 mm of rainfall. Significantly, 60-day precipitation has now averaged near to above normal with this week's rain, helping to eliminate the spring dryness. Consequently, prospects for reproductive to filling winter barley, wheat, and rapeseed were good to excellent over these growing areas, a sharp reversal from the drought that gripped much of western Europe during the first half of spring. A strong high over northwestern Russia inhibited the storms' eastward progress, leaving much of northeastern Europe dry for the week; however, the dry weather was welcome following locally heavy rain during May. Meanwhile, wet weather lingered over the southeastern Balkans, with weekly totals locally topping 50 mm. Temperatures were also quite cool (up to 5°C below normal) in these southeastern locales, slowing crop development. Conversely, the return of warmer weather (1-4°C above normal) across western, central, and northern Europe facilitated winter crop development following protracted delays brought on by one of the coldest meteorological springs (March-May) on record.

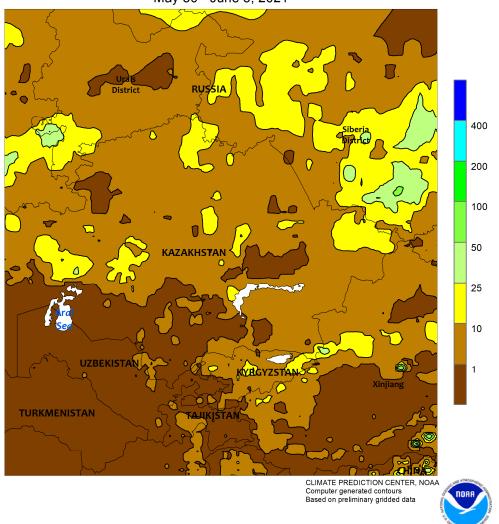

WESTERN FSU Total Precipitation (mm) May 30 - June 5, 2021

WESTERN FSU

Soaking rain maintained adequate to abundant moisture supplies for reproductive to filling winter grains and oilseeds, though drier weather would be welcome as crops approach maturity. A large stationary area of high pressure over northwestern Russia caused a sprawling storm system to stall over the Black Sea Region, resulting in a wide swath of heavy rain (25-100 mm) from Moldova and southern Ukraine northeastward into southern and western Russia. As a result, prospects for winter wheat, barley, and rapeseed remained excellent, though drier weather would be welcome to maintain crop quality and limit disease potential. Rainfall since April 1

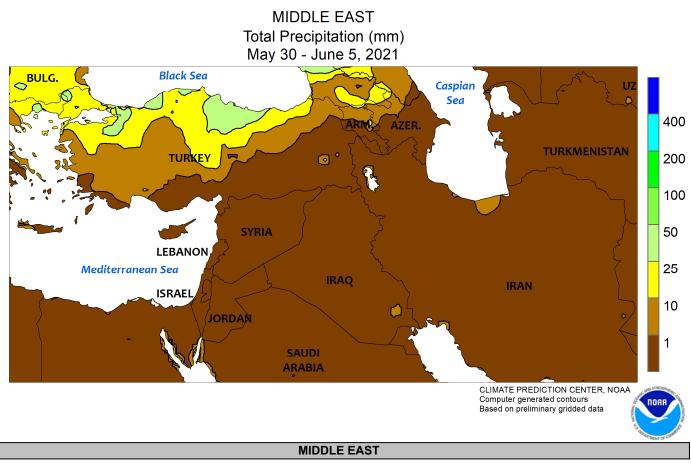

has been the highest of the past 30 years in southern Moldova (more than twice the normal amount), Ukraine's Black Sea Lowlands (nearly 200 percent of normal), and the Azov Plateau in southeastern Ukraine (more than 175 percent of normal). Conversely, croplands in Belarus and northwestern Russia were dry during the week, facilitating fieldwork as well as the development of spring grains and oilseeds. Temperatures averaged 2 to 4°C below normal, which on top of the cloudy, wet weather slowed the development of reproductive to filling winter crops and emerging to vegetative spring grains and summer crops.

EASTERN FSU

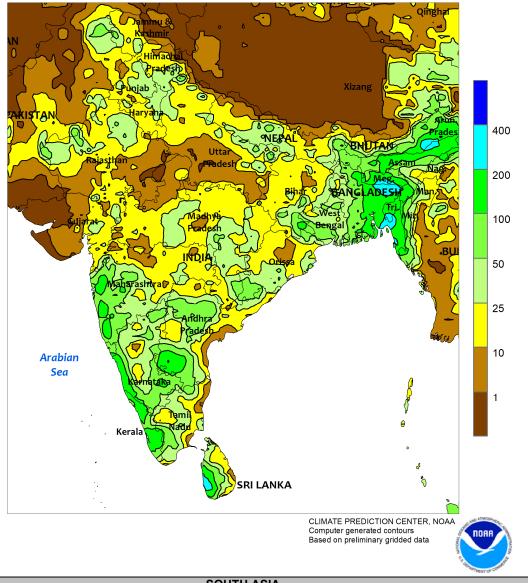

A much-needed respite from extreme heat and drought arrived in the spring grain belt, while oppressive heat and dryness lingered in the cotton region to the south. A cold front triggered showers and thunderstorms across the drought-afflicted spring wheat and barley areas of northern Kazakhstan and central Russia, though amounts were highly variable; weekly totals ranged from less than 5 mm in northwestern Kazakhstan to more than 50 mm in Russia's Siberia District. Even with this week's rain and cooler temperatures (near normal in the far north, up to 4°C above normal in southern and eastern crop areas), prospects for spring grains remained bleak. In particular, the Kostanay Region of northwestern Kazakhstan has reported less than 30 percent of normal rainfall since April 1, while Pavlodar in eastern Kazakhstan has reported less than 25 percent over the same timeframe; these paltry totals were the lowest of the past 30 years for both locales. Conditions were marginally better in parts of central Russia, though the central Forest Region (southeastern Urals District into the western Siberia

District) was likewise the driest of the past 30 years since April 1, with rain tallying a meager 30 percent of normal. Overall, widespread soaking rainfall will be needed soon to stave off potentially significant crop losses from this season's protracted severe drought. In the south, mostly sunny skies and blistering heat (5-9°C above normal, with daytime readings into the middle and upper 40s) across Uzbekistan and environs favored fieldwork but heightened irrigation demands for recently planted cotton. The average daytime high from May 15 through June 6 was more than 5°C above normal and by far the highest of the past 30 years for this timeframe in South Kazakhstan (34°C), the central Foothills of Uzbekistan (37°C), and in Turkmenistan (38°C). Furthermore, much of the cotton belt experienced subpar cool-season precipitation (September-May), which also ended early. While cotton is a heat tolerant crop, temperatures of this magnitude can have adverse effects on plant establishment, especially in areas where irrigation supplies are limited.

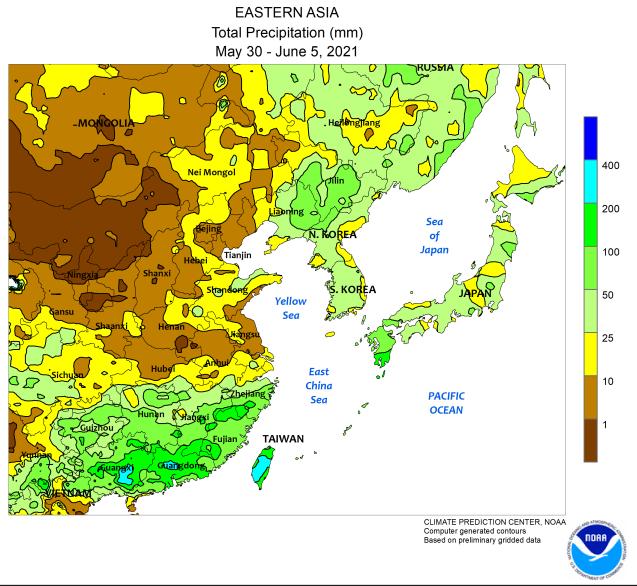

Rain and cooler temperatures favored summer crops in central and western Turkey but were too late for maturing winter grains. Widespread showers and thunderstorms (5-45 mm) across central and northern Turkey favored emerging to vegetative sunflowers, corn, and cotton. However, the rain was too late for drought-afflicted winter wheat and barley on the Anatolian Plateau. Dry, warm weather in southern Turkey maintained drought and heightened irrigation requirements for corn and cotton, though winter crop harvesting was able to proceed at a rapid pace. Elsewhere, sunny skies and abovenormal temperatures facilitated winter grain drydown and harvesting from Syria into central and southern Iran.

SOUTH ASIA Total Precipitation (mm) May 30 - June 5, 2021

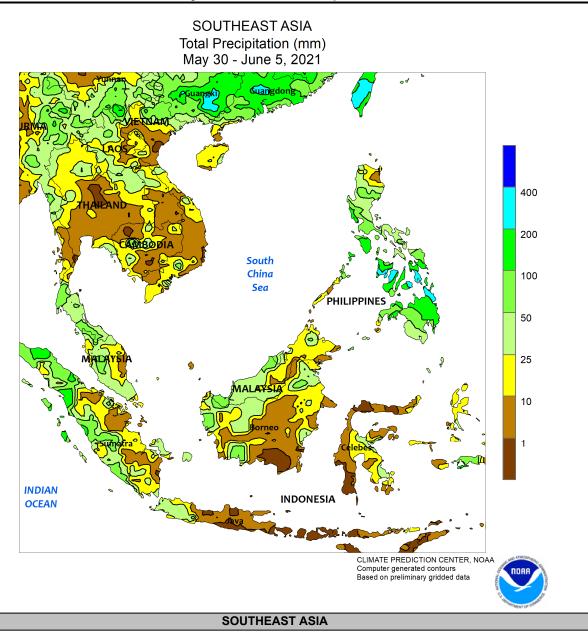

SOUTH ASIA

The southwest monsoon accelerated up western India, while the pace of onset in the east was generally on par with normal. As such, much of the southern peninsula received widespread showers (25-100 mm in most locales), encouraging sowing of rain-fed kharif crops. Lesser amounts (1-25 mm) were recorded to the north into key cotton and oilseed areas of Maharashtra, eastern Gujarat, and Madhya Pradesh. Meanwhile, 10 to 50 mm of pre-monsoon rain in far northern India, extending into neighboring portions of Pakistan, supplemented irrigation for rice and cotton. The highest rainfall totals (100-200 mm) for the region were most widespread in northeastern-most India and Bangladesh, supporting rice establishment and development. With the onset of seasonal rains, daytime temperatures in interior India dropped from the lower 40s (degrees C) to the mid-30s (nearly 5°C below normal).

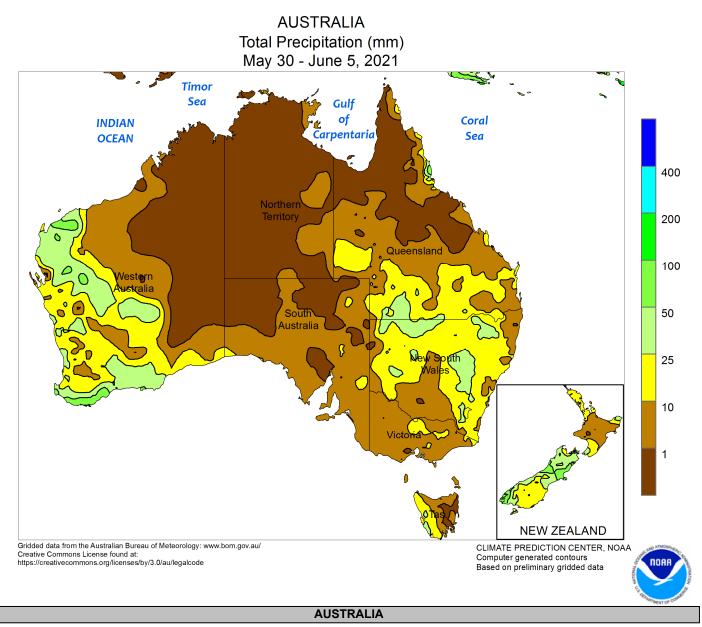

EASTERN ASIA

Downpours occurred along the monsoon boundary in southern China, with most locales reporting 50 to 100 mm or more. The moisture benefited vegetative singlecrop rice and other summer crops in southern portions of the Yangtze Valley, but was likely unfavorable for ripening early-crop rice in the far southern provinces. Additionally, the wet weather eased 90-day rainfall deficits in southeastern provinces, bringing totals back to normal in all but Guangdong; Guangdong's moisture situation improved but was still well below average (50 percent of normal). Meanwhile in northeastern China, a slow moving low pressure system produced widespread showers (25-100 mm in most locations), improving soil moisture for vegetative corn, soybeans, and rice. All northeastern locations recorded 30-day rainfall totals above normal, the exception being Inner Mongolia, where amounts totaled less than half of normal. Similar rainfall amounts improved moisture conditions for rice and other summer crops on the Korean Peninsula and throughout Japan. In western China, warm weather continued to benefit cotton, although a brief period of excessive heat (daytime temperatures approaching 40°C) caused some stress. In other parts of the region, a weak tropical cyclone (Choi-Wan) skimmed Taiwan and brought much-needed rainfall (upwards of 300 mm) to ease a year-long drought.

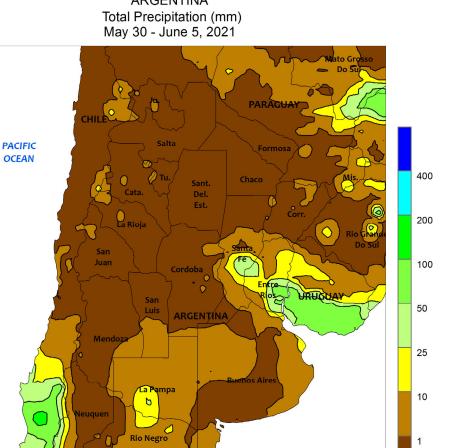

Despite the onset of the southwest monsoon, mostly dry weather prevailed across Thailand and environs. Rainfall was limited to the northern periphery of Thailand and was unseasonably light (10-35 mm). The late start of the wet season coupled with inconsistent rain thus far has left most agricultural areas with sub-par moisture over the last 30 days. In contrast, showers covered the Philippines, with all but the northern-most districts reporting 25 to 100 mm or more. The rainfall was partly related to a weak tropical cyclone (Choi-Wan) crossing the Visayas around mid-week. While the rainfall was welcome, more is needed in the key rice and corn areas of Luzon. In southern sections of the region, rainfall remained spotty in oil palm areas of Malaysia and Indonesia, as some locales recorded 50 to 100 mm and others less than 25 mm. Although rainfall has been inconsistent over the last two weeks, longer-term moisture conditions remained favorable from wetter-than-normal weather earlier in the spring.

Widespread showers (generally 10-40 mm) in the Western Australia wheat belt sustained good to excellent early-season yield prospects for recently sown winter grains and oilseeds. Similarly, widespread showers (generally 10-30 mm) in southern Queensland and most of New South Wales promoted winter crop establishment and helped maintain good to excellent crop conditions. Farther south, more widely scattered, lighter

showers (mostly 1-5 mm, locally more) dotted Victoria and South Australia, providing a limited amount of additional moisture to recently planted wheat, barley, and canola. More rain would be welcome in the southeast to encourage winter crop germination, emergence, and establishment. Temperatures averaged near to somewhat below normal (up to 2°C below normal) in Australia's wheat belt.

ARGENTINA

0

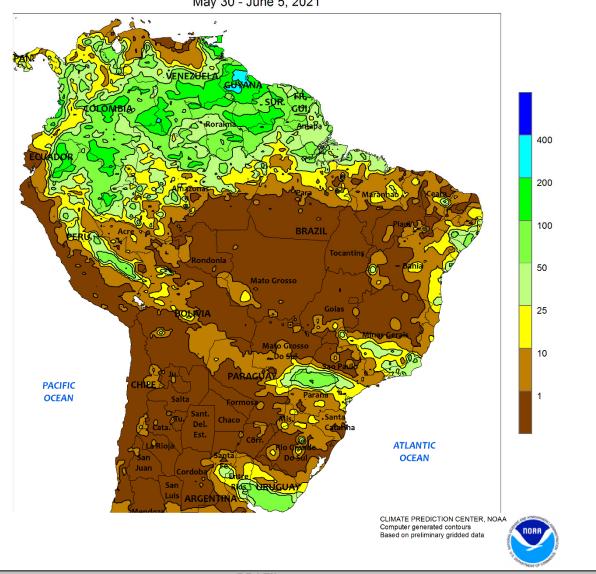

Mostly dry, warmer-than-normal weather continued throughout most major agricultural areas, supporting seasonal fieldwork that included delayed summer crop harvesting and winter grain planting. Aside from some scattered, light showers (rainfall totaling 5 mm or less) in Buenos Aires and La Pampa, rain (10-50 mm, locally exceeding 75 mm) was confined to farmlands stretching from central Santa Fe eastward through southern Uruguay. Weekly temperatures averaged 1 to 4°C above normal,

with highest daytime temperatures ranging from the upper 10s (degrees C) to the middle 30s in a section of northern Argentina centered over Chaco. According to the government of Argentina, soybean harvesting was 100 percent complete by June 3. Meanwhile, corn was 48 percent harvested, lagging last year by 19 points, and cotton was 60 percent harvested (86 percent last year). In addition, wheat was 17 percent planted, led by Cordoba at 46 percent complete.

CLIMATE PREDICTION CENTER, NOAA Computer generated contours Based on preliminary gridded data

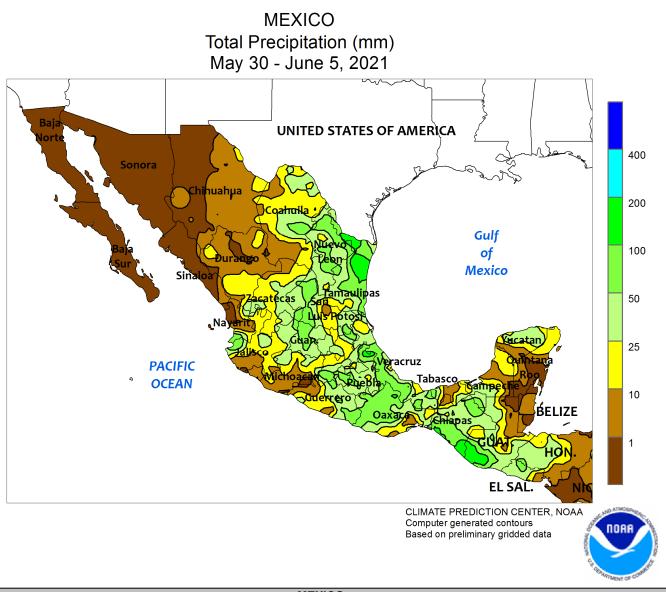

1

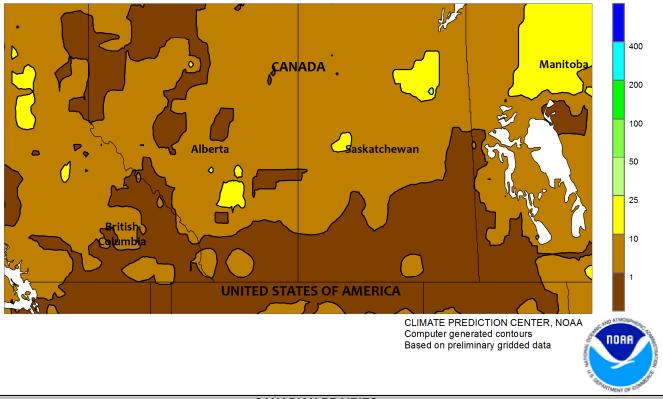

BRAZIL

Isolated showers brought limited relief to Brazil's droughtstressed corn crop. The early-week rain (10-50 mm, locally higher) spread from western Parana to southern Minas Gerais over several days, though pockets of dryness persisted over large sections of Sao Paulo and rain in Mato Grosso do Sul was confined to southern-most farming areas. While coming too late for earlier-planted crops, the moisture was nonetheless welcome: according to the government of Parana, 44 percent of second-crop corn was flowering to filling as of May 31. Emerging Parana wheat (71 percent planted) also benefited from the moisture. Elsewhere in southern Brazil, drier conditions promoted seasonal fieldwork. According to the government of Rio Grande do Sul, corn was 92 percent harvested as of June 3, and the expected expansion of wheat planting was noted. Meanwhile, dry, generally warm weather (daytime highs reaching the lower and middle 30s degrees C) fostered rapid development of corn and cotton in key production areas of central and northeastern Brazil.

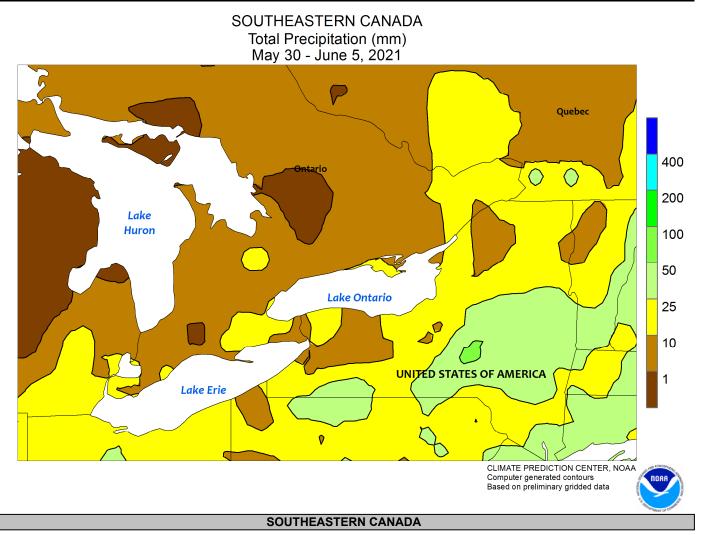

MEXICO

Seasonal showers intensified throughout much of the region, providing much-needed moisture for corn and other rain-fed summer crops. Moderate to heavy rain (25-100 mm, locally higher) was prevalent from the Rio Grande Valley (Coahuila to Tamaulipas) southward, including a broad area of the southern plateau (Guanajuato to Puebla) and the southeast (Oaxaca to Campeche). The rain also helped to alleviate dryness in and around Veracruz, where moisture was becoming limited for sugarcane, soybeans, and other summer crops concentrated in that region. Additionally, lighter showers (rainfall totaling 5-25 mm) extended westward into Michoacán and Jalisco, providing timely moisture for germinating corn. While the beneficial rain extended northward into southern Durango, monsoon showers had yet to develop over key northwestern watersheds in Sinaloa, Sonora, and Chihuahua, where reservoirs are critically low. Daytime highs in the middle and upper 30s (degrees C) were common in the drier northwest, maintaining high water requirements for livestock. CANADIAN PRAIRIES Total Precipitation (mm) May 30 - June 5, 2021

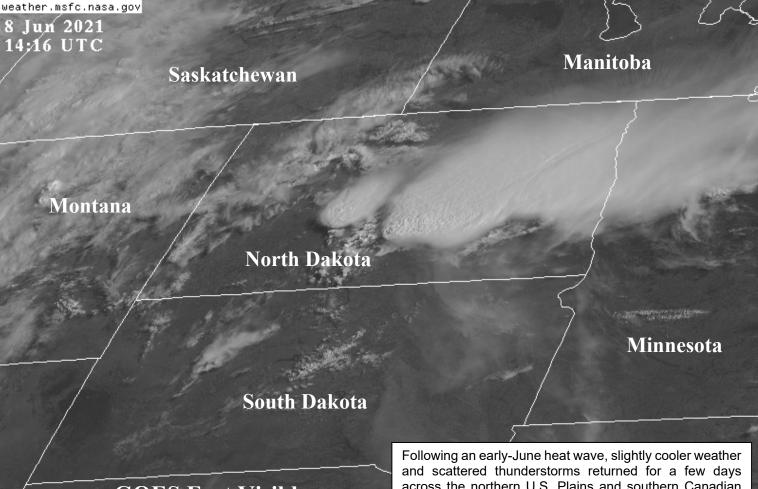

CANADIAN PRAIRIES

A late-week heat wave dried topsoils across the southern Prairies and raised concern for additional stress on emerged spring and summer crops in drought-afflicted sections of the southeast. While initially beneficial after recent bouts of frost, the rapid warming pushed daytime highs into the middle and upper 30s (degrees C) from southern Alberta eastward through Manitoba, with highs approaching 40°C in the Red River Valley. Aside from scattered, generally light showers (5-15 mm) concentrated over Alberta's central farmlands, dryness dominated. It was the second week of dryness in Manitoba, and the lack of soil moisture compounded the impacts of the heat on emerged crops that as recently as last week had been scouted for freeze damage. According to provincial reports, planting of all crops ranged from 96 to 99 percent as of June 1; Manitoba reported some replanting of oilseeds was underway following last week's frost damage.

Warm, showery weather prevailed across the region, spurring a more rapid pace of growth for emerging summer crops and winter wheat advancing toward reproduction. Patchy frost lingered early in the week, but gradual warming resulted in daytime highs reaching the upper 20s and lower 30s (degrees C) and nighttime lows well above 10°C by week's end. Rainfall accompanying the warming trend was generally light, totaling 5 to 25 mm in the agricultural districts of Ontario and Quebec. While beneficial, the moisture was insufficient to recharge soil moisture in areas that had been trending dry for much of the season. A report issued by the government of Ontario on June 2 encouraged assessments of soybean fields before replanting due to dryness and recent frost damage.

GOES East Visible June 8, 2021 9:16 am CDT Following an early-June heat wave, slightly cooler weather and scattered thunderstorms returned for a few days across the northern U.S. Plains and southern Canadian Prairies. On June 6, before the temporary pattern change occurred, USDA/NASS rated topsoil moisture at least onehalf very short to short in North Dakota (84%), South Dakota (78%), Montana (51%), and Minnesota (51%).

The Weekly Weather and Crop Bulletin (ISSN 0043-1974) is jointly prepared by the U.S. Department of Commerce, National Oceanic and Atmospheric Administration (NOAA) and the U.S. Department of Agriculture (USDA). Publication began in 1872 as the Weekly Weather Chronicle. It is issued under general authority of the Act of January 12, 1895 (44-USC 213), 53rd Congress, 3rd Session. The contents may be redistributed freely with proper credit.
